

Data Cleaning for the Scrape Data

Data Source Gofundme (Gaza fundraisers)

Date 7th July 2024 -

Environment: Jupyter Notebook- Python 3(ipynbkernel)Idle

```
In [80]: import pandas as pd

# Load the CSV file into a DataFrame
file_path = r'C:\Users\USER\Documents\gofundme_campaigns1.csv'

gofundme = pd.read_csv(file_path)
# Display the first few rows of each data frame for verification
display(gofundme.head())
```

The script above is for loading and verifying the GoFundMe campaign data extracted by the web scraper. The data is stored in a CSV file, which is read into a pandas DataFrame for further analysis.

Prerequisites

Before running the code, ensure you have the following:

- Python installed on your machine.
- The `pandas` library installed (`pip install pandas`).
- The CSV file containing the GoFundMe campaign data.

Code Explanation

Step 1: Import pandas

First, import the pandas library, which is essential for data manipulation and analysis.

```
import pandas as pd
```

Step 2: Load the CSV File into a DataFrame

Specify the path to the CSV file containing the GoFundMe campaign data. Then, use the `pd.read_csv` function to load the data into a pandas DataFrame.

```
# Specify the path to the CSV file
file_path = r'C:\Users\USER\Documents\gofundme_campaigns1.csv'

# Load the CSV file into a DataFrame
gofundme = pd.read_csv(file_path)
```

Step 3: Display the First Few Rows of the DataFrame

To verify that the data has been loaded correctly, display the first few rows of the DataFrame using the `head` method.

```
# Display the first few rows of the DataFrame for verification
print(gofundme.head())
```

Running the Script

1. Ensure that the path to the CSV file is correct and that the file exists at that location.
2. Run the script in your Python environment (e.g., using an IDE like PyCharm, VSCode, or a Jupyter notebook).
3. The first few rows of the DataFrame will be printed to the console, allowing you to verify that the data has been loaded correctly.

Conclusion

This script demonstrates how to load a CSV file containing GoFundMe campaign data into a pandas DataFrame and verify its contents. The DataFrame can then be used for further analysis, cleaning, and processing of the campaign data.

```
In [187]: # The Structure of the Datasets
gofundme.info()
# Sum of Missing Values
gofundme.isnull().sum()

<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 7 columns):
#   Column                Non-Null Count  Dtype
---  -
0   Campaign Link          1000 non-null   object
1   Campaign Title          1000 non-null   object
2   Organizer Name          998 non-null    object
3   Amount Raised           1000 non-null   object
4   Goal                    1000 non-null   object
5   Number of Donations     1000 non-null   object
6   Description             962 non-null    object
dtypes: object(7)
memory usage: 54.8+ KB

Out[187]: Campaign Link          0
Campaign Title          0
Organizer Name          2
Amount Raised           0
Goal                    0
Number of Donations     0
Description             38
dtype: int64
```

Data Cleaning Explanation and Interpretation

Code Explanation

The provided code performs an initial examination of the GoFundMe campaign data to understand its structure and identify missing values. This is an essential first step in the data cleaning process.

Step 1: Display DataFrame Structure

```
# The Structure of the Datasets
gofundme.info()
```

The `info()` method of a pandas DataFrame provides a concise summary of the DataFrame. This includes:

- The number of entries (rows) in the DataFrame.
- The number of columns and their names.
- The number of non-null entries in each column.
- The data type of each column.
- The memory usage of the DataFrame.

Step 2: Summarize Missing Values

```
# Sum of Missing Values
gofundme.isnull().sum()
```

The `isnull()` method generates a DataFrame of the same shape as `gofundme`, with `True` values indicating missing values and `False` values indicating present values. The `sum()` method then sums the `True` values (counting the missing entries) for each column, providing an overview of the missing data in the DataFrame.

Interpretation of the Results

DataFrame Structure

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1000 entries, 0 to 999
Data columns (total 7 columns):
#   Column                Non-Null Count  Dtype
---  -
0   Campaign Link         1000 non-null  object
1   Campaign Title        1000 non-null  object
2   Organizer Name        998 non-null   object
3   Amount Raised         1000 non-null  object
4   Goal                  1000 non-null  object
5   Number of Donations   1000 non-null  object
6   Description            962 non-null   object
dtypes: object(7)
memory usage: 54.8+ KB
```

- The DataFrame contains 1000 rows and 7 columns.
- The columns are: Campaign Link, Campaign Title, Organizer Name, Amount Raised, Goal, Number of Donations, and Description.
- Most columns have 1000 non-null entries, except for Organizer Name and Description.
- All columns are of data type object, which in pandas typically means they contain strings.

Missing Values

```
Campaign Link      0
Campaign Title     0
Organizer Name     2
Amount Raised      0
Goal               0
Number of Donations 0
Description        38
dtype: int64
```

- There are no missing values in the Campaign Link, Campaign Title, Amount Raised, Goal, and Number of Donations columns.
- The Organizer Name column has 2 missing values.
- The Description column has 38 missing values.

Next Steps in Data Cleaning

Based on this initial examination, the next steps in the data cleaning process might include:

1. Handling Missing Values:

- will do data re-scraping to try and fill in the missing values.

2. Converting Data Types:

- The Amount Raised, Goal, and Number of Donations columns are currently of type object these columns represent numerical values, therefore they should be converted to appropriate numerical types (e.g., float or int) after cleaning any non-numeric characters.

3. Further Data Cleaning:

- Remove any unwanted characters (e.g., currency symbols) from numerical columns.
- Normalize textual data for consistency (e.g., consistent casing, removal of extra whitespace).

From the above we see there are some campaigns with missing data to deal with this we will do data re-scraping to try and fill in the missing values, here; during the entire process, we will include a mechanism to save progress periodically, similar to the main script. This is done every 10 iterations to avoid data loss in case of interruptions.

- We will extract Missing Values by identifying the rows with missing values using `gofundme[gofundme.isnull().any(axis=1)]`.
- Scrape Campaign Data by defining a function `scrape_campaign_data` to re-scrap data based on campaign links. Update DataFrame by iterating over the extracted rows, re-scraping data where necessary, and updating the missing values.
- Merge DataFrames using the `combine_first` to merge the updated rows back into the original DataFrame without affecting the complete rows.
- Save the updated DataFrame to a new CSV file.

This script ensures that all rows with complete data remain unaffected while updating only those with missing values.

```

```

Re-scraping to Handle Missing Values: Explanation and Interpretation

Purpose

The goal of this script is to re-scrape data for GoFundMe campaigns to handle missing values in the dataset. The script targets rows with missing values, re-scrapes the required information, and updates the dataset.

Code Explanation

Step 1: Import Required Libraries

```

import pandas as pd
from selenium import webdriver
from selenium.webdriver.edge.service import Service
from selenium.webdriver.support.ui import WebDriverWait
from selenium.webdriver.support import expected_conditions as EC

```

```

from selenium.webdriver.common.by import By
from bs4 import BeautifulSoup
import time
import json
import os

```

These libraries are essential for web scraping (`selenium` and `BeautifulSoup`), data manipulation (`pandas`), and file handling (`os` and `json`).

Step 2: Load the CSV File and Extract Rows with Missing Values

```

file_path = r'C:\Users\USER\Documents\gofundme_campaigns1.csv'
gofundme = pd.read_csv(file_path)

```

```

# Extract rows with missing values

```

```

missing_values_df = gofundme[gofundme.isnull().any(axis=1)].copy()

```

The CSV file is loaded into a DataFrame, and rows with missing values are extracted for further processing.

Step 3: Load Saved Progress (if exists)

```

progress_file_path = r'C:\Users\USER\Documents\progress_gofundme_missing1.json'

```

```

if os.path.exists(progress_file_path):
    try:
        with open(progress_file_path, 'r') as file:
            progress = json.load(file)
            start_index = progress['last_index'] + 1
            print(f"Loaded progress: start_index={start_index}")
    except (json.JSONDecodeError, KeyError) as e:
        print(f"Error loading progress file: {e}")
        start_index = 0
else:
    start_index = 0

```

This section loads progress from a previous run, allowing the script to resume where it left off.

Step 4: Set Up the WebDriver

```

edge_driver_path = r'C:\Users\USER\Downloads\edgedriver_win64\msedgedriver.exe'
service = Service(edge_driver_path)

```

```

def init_driver():
    options = webdriver.EdgeOptions()
    options.add_argument('headless')
    driver = webdriver.Edge(service=service, options=options)
    return driver

```

```

driver = init_driver()

```

The WebDriver is set up to use Microsoft Edge in headless mode, allowing for automated browsing.

Step 5: Define the Scraping Function

```

def scrape_campaign_data(link):
    driver.get(link)
    WebDriverWait(driver, 30).until(
        EC.presence_of_element_located((By.CLASS_NAME, 'hrt-disp-inline'))
    )

    retry_count = 3
    for attempt in range(retry_count):
        try:
            read_more_button = WebDriverWait(driver, 15).until(
                EC.element_to_be_clickable((By.CSS_SELECTOR, 'button[data-element-id="btn_story_read-more"]'))
            )
            read_more_button.click()
            WebDriverWait(driver, 15).until(
                EC.staleness_of(read_more_button)
            )
            break
        except Exception as e:
            if attempt < retry_count - 1:
                print(f"Retrying ({attempt+1}/{retry_count})...")
                time.sleep(10)
            else:
                print(f"Read more button not found or not clickable: {e}")

    campaign_page_source = driver.page_source
    campaign_soup = BeautifulSoup(campaign_page_source, 'html.parser')

```

```

        amount_raised_text = campaign_soup.find('div', class_='hrt-disp-inline').get_text().strip() if
campaign_soup.find('div', class_='hrt-disp-inline') else ""
        goal_text = campaign_soup.find('span', class_='hrt-text-body-sm hrt-text-
gray').get_text().strip() if campaign_soup.find('span', 'hrt-text-body-sm hrt-text-gray') else ""
        donations_no_text = campaign_soup.find('span', class_='hrt-text-gray-dark').get_text().strip()
if campaign_soup.find('span', class_='hrt-text-gray-dark') else ""

        description_div = campaign_soup.find('div', class_='campaign-
description_campaignDescription__6P_RU')
        description_text = ''
        allowed_tags = ['p', 'div', 'h1', 'h2', 'h3', 'h4', 'h5', 'h6', 'ul', 'ol', 'li', 'span',

        if description_div:
            for element in description_div.find_all(allowed_tags, recursive=False):
                if element.name == 'div' and element.find('img') is not None:
                    continue
                description_text += element.get_text(separator=' ', strip=True) + ' '

        description_text = description_text.strip()

    return {
        'Amount Raised': amount_raised_text,
        'Goal': goal_text,
        'Number of Donations': donations_no_text,
        'Description': description_text
    }

```

This function navigates to a campaign page, extracts the required data, and returns it in a dictionary.

Step 6: Scrape Missing Values

```

updated_rows_df = pd.DataFrame(columns=missing_values_df.columns)

for index in range(start_index, len(missing_values_df)):
    row = missing_values_df.iloc[index]
    link = row['Campaign Link']

    print(f"Scraping data for: {link}")
    try:
        updated_data = scrape_campaign_data(link)
        for key, value in updated_data.items():
            row[key] = value
        updated_rows_df = pd.concat([updated_rows_df, row.to_frame().T], ignore_index=True)
        print(f"Updated row added for index {index}")

        if index % 4 == 0:
            with open(progress_file_path, 'w') as file:
                json.dump({
                    'missing_values_df': updated_rows_df.to_dict(),
                    'last_index': index
                }, file)
            print(f"Progress saved at index {index}")

    except Exception as e:
        print(f"An error occurred: {e}")
        driver.quit()
        driver = init_driver()
        continue

with open(progress_file_path, 'w') as file:
    json.dump({
        'missing_values_df': updated_rows_df.to_dict(),
        'last_index': len(missing_values_df) - 1
    }, file)

updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated_missing_values1.csv'
updated_rows_df.to_csv(updated_file_path, index=False)

print("Updated data saved to CSV.")
driver.quit()

```

This section iterates over the rows with missing values, scrapes the required data, updates the rows, and periodically saves progress. The updated data is then saved to a new CSV file.

Major Function of the code

- **Re-scraping Efficiency:** This method ensures that missing values are handled by re-scraping the required information from the source. It minimizes manual data entry and ensures accuracy.

- **Progress Tracking:** By saving progress at regular intervals, the script ensures that long-running scraping tasks can be resumed without starting from scratch, making the process more robust against interruptions.
- **Updated Data:** The final output is an updated CSV file with previously missing values filled in, improving the completeness and reliability of the dataset.

```
In [126.. import pandas as pd

# Load the original gofundme DataFrame
original_file_path = r'C:\Users\USER\Documents\gofundme_campaigns1.csv'
gofundme = pd.read_csv(original_file_path)

# Load the updated rows DataFrame
updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated_missing_values1.csv'
updated_rows_df = pd.read_csv(updated_file_path)

# Set 'Campaign Link' as the index for both DataFrames for easier updating
gofundme.set_index('Campaign Link', inplace=True)
updated_rows_df.set_index('Campaign Link', inplace=True)

# Update the original DataFrame with values from the updated DataFrame
gofundme.update(updated_rows_df)

# Reset the index to restore 'Campaign Link' as a column
gofundme.reset_index(inplace=True)

# Save the updated DataFrame to a new CSV file
final_updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated01.csv'
gofundme.to_csv(final_updated_file_path, index=False)

print("Replaced missing values and saved the updated DataFrame to CSV.")
```

Replaced missing values and saved the updated DataFrame to CSV.

```
In [132.. updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated01.csv'
gofundme_updated1 = pd.read_csv(updated_file_path)
# Display missing values
print(gofundme_updated1.isnull().sum())

gofundme_updated1.info()
```

```

Replacing Missing Values and Verifying Results

Introduction

The section above describes the process of integrating updated data back into the original dataset, replacing missing values, and verifying the results. The goal is to ensure that the dataset is complete and ready for further analysis.

Code Explanation

Step 1: Load Original and Updated DataFrames

```
import pandas as pd

# Load the original GoFundMe DataFrame
original_file_path = r'C:\Users\USER\Documents\gofundme_campaigns1.csv'
gofundme = pd.read_csv(original_file_path)
```

```
# Load the updated rows DataFrame
```

```
updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated_missing_values1.csv'  
updated_rows_df = pd.read_csv(updated_file_path)
```

Here, we load the original dataset and the updated rows into separate DataFrames. The original dataset contains the initial data, including rows with missing values. The updated rows DataFrame contains the re-scraped data for those rows with previously missing values.

Step 2: Set 'Campaign Link' as the Index

```
# Set 'Campaign Link' as the index for both DataFrames for easier updating
```

```
gofundme.set_index('Campaign Link', inplace=True)  
updated_rows_df.set_index('Campaign Link', inplace=True)
```

Setting 'Campaign Link' as the index in both DataFrames ensures that updates are applied correctly based on the unique campaign links.

Step 3: Update the Original DataFrame

```
# Update the original DataFrame with values from the updated DataFrame
```

```
gofundme.update(updated_rows_df)
```

The `update` method replaces the missing values in the original DataFrame with the corresponding values from the updated DataFrame.

Step 4: Reset the Index

```
# Reset the index to restore 'Campaign Link' as a column
```

```
gofundme.reset_index(inplace=True)
```

After updating, the index is reset to restore 'Campaign Link' as a regular column in the DataFrame.

Step 5: Save the Updated DataFrame

```
# Save the updated DataFrame to a new CSV file
```

```
final_updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated01.csv'  
gofundme.to_csv(final_updated_file_path, index=False)
```

```
print("Replaced missing values and saved the updated DataFrame to CSV.")
```

The updated DataFrame, now free of missing values, is saved to a new CSV file for future use.

Step 6: Verify the Updated DataFrame

```
# Load the final updated DataFrame
```

```
updated_file_path = r'C:\Users\USER\Documents\gofundme_campaigns_updated01.csv'  
gofundme_updated1 = pd.read_csv(updated_file_path)
```

```
# Display missing values
```

```
print(gofundme_updated1.isnull().sum())
```

```
gofundme_updated1.info()
```

Finally, the script reloads the final updated DataFrame to verify that all missing values have been replaced. It prints the count of missing values in each column and provides a summary of the DataFrame's structure.

But we see there are still some missing values so we will Repeat the process to fill the missing values

Repeat the process to fill the missing values

In [131]

```
# Extract rows with missing values
```

```
missing_values_df = gofundme_updated1[gofundme_updated1.isnull().any(axis=1)].copy() # Make a copy to avoid Se
```

```
# Define the full path to the progress file
```

```
progress_file_path = r'C:\Users\USER\Documents\progress_gofundme_missing01.json'
```

```
# Load saved progress if exists and valid
```

```
if os.path.exists(progress_file_path):
```

```
    try:
```

```
        with open(progress_file_path, 'r') as file:
```

```
            progress = json.load(file)
```

```
            start_index = progress['last_index'] + 1 # Start from the next index
```

```
            print(f"Loaded progress: start_index={start_index}")
```

```
        except (json.JSONDecodeError, KeyError) as e:

Data Cleaning Code Explanation

This section explains the process of cleaning the data in the GoFundMe dataset. The objective is to ensure that the data is in a consistent and usable format for analysis.

Step 1: Import Libraries

```
import re
import pandas as pd
```

We import the `re` library for regular expressions and `pandas` for data manipulation.

Step 2: Clean the 'Amount Raised' Column

```
# Function to clean the amount raised by removing symbols and commas
def clean_amount(amount_raised):
    cleaned_amount = re.sub(r'[^\d.]', '', str(amount_raised))
    return cleaned_amount
```

```
# Apply the function to the Amount_Raised column
gofundme_updated['Amount_Raised_cleaned'] = gofundme_updated['Amount_Raised'].apply(clean_amount)
```

- **Function `clean_amount`**: This function removes all non-numeric characters from the 'Amount Raised' column except for the decimal point.
- **Apply Function**: The function is applied to the 'Amount Raised' column, creating a new column 'Amount_Raised_cleaned' with the cleaned values.

Step 3: Extract Numbers from the 'Goal' Column

```
# Function to extract numbers from goal text
def extract_numbers(goal_text):
    numbers = ''.join(re.findall(r'\d+', goal_text))
    return numbers
```

```
# Apply the function to the 'Goal' column
gofundme_updated['Goal_Clean'] = gofundme_updated['Goal'].apply(extract_numbers)
```

- **Function `extract_numbers`**: This function finds all numeric characters in the 'Goal' text and joins them into a single string.
- **Apply Function**: The function is applied to the 'Goal' column, creating a new column 'Goal_Clean' with only numeric values.

Step 4: Clean the 'Description' Column

```
# Function to remove all symbols except punctuation marks and words
def remove_symbols(description_text):
    if isinstance(description_text, str):
        cleaned_text = re.sub(r'^a-zA-Z0-9\s.,!?\'"`-]', '', description_text)
        return cleaned_text
    else:
        return ''
```

```
# Apply the function to the 'Description' column
gofundme_updated['Description_Clean'] = gofundme_updated['Description'].apply(remove_symbols)
```

- **Function `remove_symbols`**: This function removes all characters from the 'Description' column except for alphanumeric characters, spaces, and common punctuation marks.
- **Apply Function**: The function is applied to the 'Description' column, creating a new column 'Description_Clean'.

Step 5: Convert 'Amount Raised' and 'Goal' to Numeric Values

```
# Function to clean and convert amount raised and goal to numeric values
def clean_currency(value):
    value = re.sub(r'^\d.', '', value)
    try:
        return float(value)
    except ValueError:
        return 0.0

# Apply the function to the 'Amount_Raised' and 'Goal' columns
gofundme_updated['Amount_Raised_Clean'] = gofundme_updated['Amount_Raised'].apply(clean_currency)
gofundme_updated['Goal_Clean'] = gofundme_updated['Goal'].apply(clean_currency)
```

- **Function `clean_currency`**: This function removes non-numeric characters except the decimal point and converts the value to a float. If conversion fails, it returns 0.0.
- **Apply Function**: The function is applied to the 'Amount Raised' and 'Goal' columns, creating 'Amount_Raised_Clean' and 'Goal_Clean' columns with numeric values.

Step 6: Clean and Convert 'Number of Donations'

```
# Function to clean and convert Number_of_Donations to numeric values
def clean_donations(value):
    if isinstance(value, str) and 'K' in value:
        value = value.replace('K', '')
        try:
            return float(value) * 1000
        except ValueError:
            return 0
    else:
        try:
            return int(value)
        except ValueError:
            return 0

# Apply the function to the 'Number_of_Donations' column
gofundme_updated['Number_of_Donations_Clean'] = gofundme_updated['Number of Donations'].apply(clean_donations)
```

- **Function `clean_donations`**: This function handles strings containing 'K' (indicating thousands) and converts them to numeric values. It attempts to convert other values to integers, returning 0 if conversion fails.
- **Apply Function**: The function is applied to the 'Number of Donations' column, creating 'Number_of_Donations_Clean'.

Step 7: Calculate Progress

```
# Calculate progress
gofundme_updated['Progress'] = (gofundme_updated['Amount_Raised_Clean'] /
gofundme_updated['Goal_Clean']) * 100
```

- **Calculate Progress**: This step calculates the progress of each campaign as a percentage of the goal achieved and stores it in the

'Progress' column.

Interpretation of Results

- **Data Consistency:** By cleaning and converting text data into numeric values, the dataset becomes consistent and suitable for analysis.
- **Enhanced Analysis:** The cleaned 'Amount Raised', 'Goal', and 'Number of Donations' columns enable more accurate calculations and visualizations.
- **Progress Calculation:** The 'Progress' column provides a clear metric of each campaign's success relative to its goal.

This data cleaning process ensures that the GoFundMe dataset is prepared for detailed analysis, supporting the study of persuasive narratives and support mobilization for campaigns related to Gaza.

print(f"Cleaned data successfully saved to {cleaned_file_path}")
```

Cleaned data successfully saved to C:/Users/USER/Documents/gofundme_Project_data.csv

Explanation of the Code

This section of the code focuses on organizing and saving the cleaned data, ensuring that it is in the correct format for analysis and that any encoding issues are addressed.

Step 1: Create a New DataFrame with Specific Columns

```
# Create the new DataFrame with the specified columns in the given order
gofundme_updated1 = gofundme_updated[['Campaign Link', 'Campaign Title', 'Organizer Name',
                                       'Number of Donations', 'Number_of_Donations_Clean',
                                       'Amount_Raised_Clean', 'Goal_Clean',
                                       'Progress', 'Description_Clean']]
```

- **Purpose:** This step creates a new DataFrame, `gofundme_updated1`, with a specific subset of columns in a defined order.
- **Columns Selected:**
 - 'Campaign Link'
 - 'Campaign Title'
 - 'Organizer Name'
 - 'Number of Donations'
 - 'Number_of_Donations_Clean'
 - 'Amount_Raised_Clean'
 - 'Goal_Clean'
 - 'Progress'
 - 'Description_Clean'

Step 2: Display the New DataFrame

```
# Display the new DataFrame
display(gofundme_updated1)
```

- **Purpose:** This step displays the new DataFrame, allowing you to verify that the data is correctly organized and includes the necessary columns.

Step 3: Save the Cleaned DataFrame to a CSV File

```
# Save the cleaned DataFrame back to a CSV file
cleaned_file_path = r'C:/Users/USER/Documents/gofundme_final_data.csv'
gofundme_updated1.to_csv(cleaned_file_path, index=False)

print(f"Cleaned data successfully saved to {cleaned_file_path}")
```

- **Purpose:** This step saves the `gofundme_updated1` DataFrame to a CSV file named `gofundme_final_data.csv` without including the index.
- **Path:** The file is saved at `C:/Users/USER/Documents/`.

Step 4: Load the CSV File into a DataFrame with Encoding Handling

```
# Load the CSV file into a DataFrame
cleaned_file_path = r'C:/Users/USER/Documents/gofundme_final_data.csv'

# Try reading the CSV with 'utf-8' encoding first
try:
    gofundme_dataset = pd.read_csv(cleaned_file_path, encoding='utf-8')
except UnicodeDecodeError:
    # If 'utf-8' fails, use 'ISO-8859-1' as a fallback encoding
    gofundme_dataset = pd.read_csv(cleaned_file_path, encoding='ISO-8859-1')
```

- **Purpose:** This step attempts to load the CSV file into a DataFrame using 'utf-8' encoding. If 'utf-8' fails (due to a `UnicodeDecodeError`), it falls back to 'ISO-8859-1' encoding.
- **Reason:** Encoding issues can occur when reading CSV files, especially if the file contains special characters. This fallback mechanism ensures the file can be read successfully.

Step 5: Display Missing Values

```
# Display missing values
print(gofundme_dataset.isnull().sum())
```

- **Purpose:** This step checks for any remaining missing values in the DataFrame after the cleaning process.
- **Output:** The `isnull().sum()` function prints the number of missing values for each column.

Step 6: Save the Cleaned DataFrame to Another CSV File

```
# Save the cleaned DataFrame back to a CSV file
cleaned_file_path = r'C:/Users/USER/Documents/gofundme_Project_data.csv'
gofundme_dataset.to_csv(cleaned_file_path, index=False)

print(f"Cleaned data successfully saved to {cleaned_file_path}")
```

- **Purpose:** This step saves the final cleaned DataFrame to another CSV file named `gofundme_Project_data.csv` without including the index.
- **Path:** The file is saved at `C:/Users/USER/Documents/`.

Summary

- **Data Organization:** A new DataFrame with the specified columns is created and displayed for verification.
- **Data Saving:** The cleaned DataFrame is saved to a CSV file, ensuring the data is in a usable format.
- **Encoding Handling:** The CSV file is read with handling for potential encoding issues.
- **Final Checks and Saving:** The final DataFrame is checked for missing values and saved again to ensure completeness and accuracy.
